Public Health Informatics and Information Systems

Public Health Informatics and Information Systems

Let us not go over the old ground, let us rather prepare for what is to come. ?Marcus Tullius Cicero

Improvements in the health status of communities depend on effective public health and healthcare infrastructures. These infrastructures are increasingly electronic and tied to the Internet. Incorporating emerging technologies into the service of the community has become a required task for every public health leader. The revolution in information technology challenges every sector of the health enterprise. Individuals, care providers, and public health agencies can all benefit as we reshape public health through the adoption of new information systems, use of electronic methods for disease surveillance, and reformation of outmoded processes. However, realizing the benefits will be neither easy nor inexpensive. Technological innovation brings the promise of new ways of improving health. Individuals have become more involved in knowing about, and managing and improving, their own health through Internet access. Similarly, healthcare providers are transforming the ways in which they assess, treat, and document patient care through their use of new technologies. For example, point-of-care and palm-type devices will soon be capable of uniquely identifying patients, supporting patient care, and documenting treatment simply and efficiently.
